

Methodology

I started by setting some metrics for the KPIs and charts. Here they are for reference.

Metric	Formula
Highest Risk Category	MAX(dissatisfactionScore)
Highest Potential Category	MAX(opportunityScore) × 10
Customer Frustration Index	Weighted: Rating(40%) + Volume(30%) + Helpful(20%) + Verified(10%)
High-Impact Complaint Ratio	(Complaints > AvgHelpful AND Verified) / Total Complaints
Opportunity Score	Normalized sum of complaint frequency, helpful votes, and ratings
Market Opportunity Score	Scaled representation of the top Opportunity Score
Category Saturation Score	Normalized sum of review volume and brand diversity
Trend Growth (MoM)	% Change in complaints between First Half and Second Half of time

The next idea was to set accurate KPIs, charts and, most importantly, slicers/filters to keep every part of the dashboard as interactive as possible. Then, the focus was on the most important pages that would contribute the most to decision-making: 'Products' and 'Review Intelligence'.

Note: the analysis was made while the 'Verified Purchases>Yes' slicer was active.

Once everything was set up, the first step was to analyse the category-wise trendline of complaints and ratings. The focus was on the segments that had shown an increase in complaints and a decrease in average ratings in the recent past months. Simultaneously, I also reviewed the Complaint% for each product from the 'Products' page.

Upon comparing my notes to the 'Category Opportunity' page, I jumped to the conclusion that the majority and the most recent complaints revolved around Wellness and the SkinCare categories. However, I did focus on scenarios where the categories were well rated, but the products were not.

Since I had used this top-to-bottom approach, the final step was to go to the 'Review Intelligence' page to understand the major problems with these products.

Key Findings

- Price remains the highest complaint reason for every product
- 'Collagen Powder' is the highest reviewed product with the lowest average rating (43.1% complaints)
- 'Sleep Aid Melatonin' is the worst-rated product across all relevant categories.
- MamaEarth (serving the 'Hair Care' category) has the highest dissatisfaction score and lowest average ratings, with a high complaint volume.
- 'SkinCare' along with 'Beauty' shows a rise in recent complaints and a high complaint percentage. However, multiple companies are focusing on skincare products, making the market highly saturated.
- The 'Wellness' category has a high increase in recent complaints and a decrease in recent average ratings.
- 'Men's grooming' and 'Body Care' products have shown recent satisfaction.

Recommendations

Prioritising Wellness, Body Care, Hair Care and Beauty categories, along with specific products from other categories.

When it comes to Wellness, face masks show the highest amount of dissatisfaction.

1. Since it shows a high trend, Sleep aid should be the priority-
 - a. Sleep Aid Melatonin with less toxic ingredients, better quality and proper dosage instructions.
 - b. *New product ideas*: Sleep masks/ eye masks that help increase melatonin secretion. Equipment to reduce snoring to get a better REM sleep.
2. Face masks, charcoal peel masks, keratin masks (essentially all sorts of masks) that focus on:
 - a. skin personalisation
 - b. allergen-free ingredients
 - c. proper usage instructions
3. Collagen powder with:
 - a. specific age-categorisation
 - b. variety of flavours
4. Hair Growth Oil with:
 - a. better personalisation to hair type
 - b. segregation of oil for men and women
 - c. proper usage instructions
5. Body Lotion SPF is another product with bad average ratings. We can introduce new products with:
 - a. Lab-proven SPF% and transparency with ingredients and instructions (keeping in mind the current backlash on the products)
 - b. Customised to skin type

- c. Price differentiation according to usability and longevity (number of hours)
- d. Maybe an R&D based on city-wise weather and climate.
